

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-9879
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders With Flow Designer
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

These requirements describe what the laptop ordering solution must do and the quality standards it must meet while running. The functional requirements cover submitting a laptop order, checking its cost, obtaining approval where needed and creating the fulfillment task. The non-functional requirements cover how well the ServiceNow implementation performs in terms of usability, security, speed and maintainability.

- **Functional Requirements (FR)** describe what the solution actually does, for example accepting a laptop order, routing it for approval and raising a catalog task.
- **Non-Functional Requirements (NFR)** describe how well the solution does it, covering ease of use, security, response time and ease of upkeep.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/ Medium/ Low)
1	Authentication	Every user has to log in to the ServiceNow instance with personal credentials before opening the Service Catalog. Once logged in, the system records the person as the requester through the Requested for / Opened by fields.	High
2	Authorization levels	Requester: Any employee with catalog access can place a laptop order. Department Head: Approves or rejects orders that exceed the budget limit. IT Support group: Works on the fulfillment catalog tasks. Administrator: Builds and maintains the catalog item and the Flow Designer flow.	High
3	External interfaces	The solution does not connect to any third-party system or external API; it runs entirely on the native Service Catalog and Flow Designer features of ServiceNow.	Low
4	Transactions processing	Placing a laptop order generates a Request (REQ) together with a Requested Item (RITM) . The Flow Designer flow starts from the Service Catalog trigger, checks stock availability and then runs the Create Catalog Task action to raise an SCTASK for the IT Support group.	High

S.No	Requirement Category	Requirement Description	Priority (High/ Medium/ Low)
5	Reporting	Once the order is placed, the requester can follow its progress under My Requests and see the request number. A dashboard shows pending orders, the approval rate and the average delivery time, and the flow run history can be reviewed in Flow Designer.	Medium
6	Business rules, etc.	The Laptop Order item offers laptop type (Developer, Business or Basic), brand and screen size, with RAM and storage choices filtered by a Catalog UI Policy, plus optional accessories. An order within the budget limit is auto-approved ; an order above it is sent to the Department Head . After approval, a catalog task is created and assigned to the IT Support group.	High
7	Compliance to laws or regulations	Employee and request data stays inside the organization's own ServiceNow instance and is guarded by ServiceNow roles and access controls.	Low
8	Other	The catalog item is connected to the flow through its Process Engine tab, and the flow has to be activated before any order can trigger it.	High

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Once an order is submitted and approved, the flow should raise the fulfillment task on its own, with no manual step needed.	Task appears within 2 minutes after approval
2	Scalability	Every order starts its own flow run, so several laptop requests can be handled in parallel by the same flow.	Parallel orders each get their own task
3	Security & Data Privacy	Orders can be placed only by logged-in users, and request and task records are visible only to users holding the appropriate ServiceNow roles.	Mandatory login; role-based access on every record
4	Reliability & Availability	The flow runs inside the ServiceNow platform, and its execution history in Flow Designer can be checked whenever an error occurs.	Each order results in a request, an item and a task
5	Usability & Accessibility	The order form uses clear field labels, simple selection lists and a confirmation message that shows the request number after submission.	Order submitted in a few clicks; confirmation displayed

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
6	Other	The flow is built visually in Flow Designer without custom code, so administrators can change it easily when requirements change.	Flow built with no custom scripting
